

CYLINDER HEAD COVERS

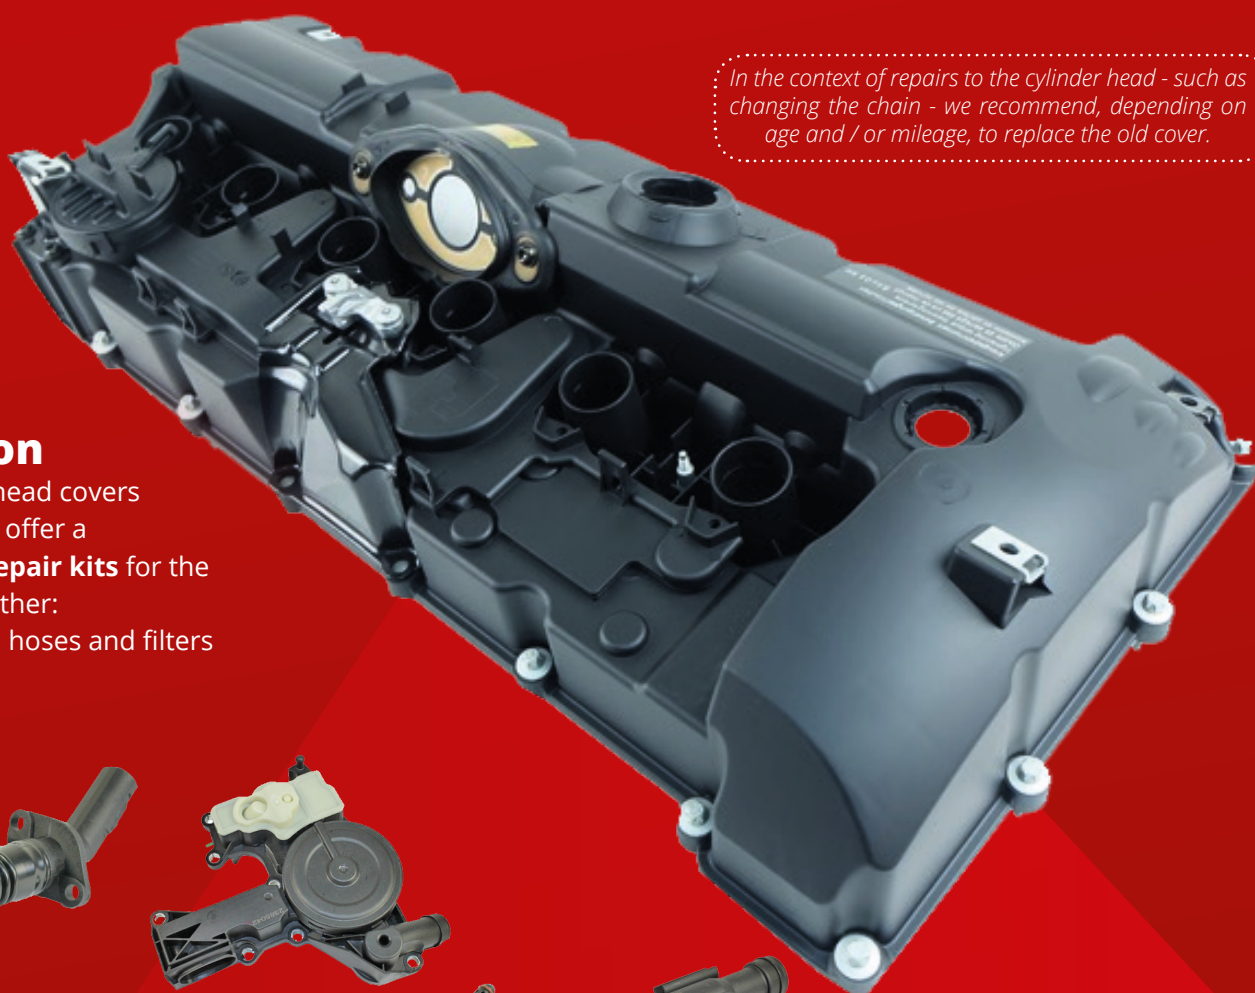

partially with integrated crankcase ventilation

metzger 
Autoteile

Modern engines work with a slight underpressure inside.
This avoids that any oil vapours from the crankcase can escape into the environment.

The crankcase pressure is regulated by a spring-controlled membrane. The valve can be integrated in the cylinder head cover or designed as an external valve. With increased mileage, leaks at the cylinder head cover and defective pressure control valves occur.

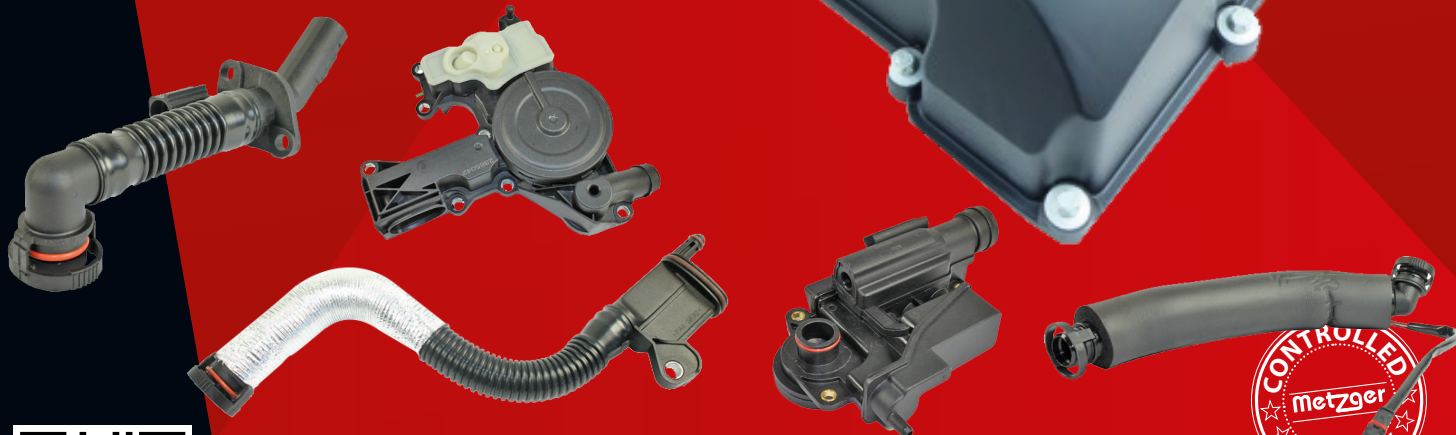

- **OE-compliant fit**
- **High quality gaskets and screws**

In the context of repairs to the cylinder head - such as changing the chain - we recommend, depending on age and / or mileage, to replace the old cover.

In addition

to the cylinder head covers
we at METZGER offer a
wide range of **repair kits** for the
crankcase breather:
oil traps, valves, hoses and filters
